T-Test Calculator for 2 Independent Means

Success!

Explanation of results

The output of this calculator is pretty straightforward. The values of *t* and *p* appear at the bottom of the page. If the text is blue, your result is significant; if it's red, it's not. The only thing that might catch you out is the way that we've rounded the data. The data you see in front of you, apart from the *t* and *p* values at the page bottom, has been rounded to 2 significant figures. However, we did not round when actually calculating the values of *t* and *p*. This means if you try to calculate these values on the basis of the summary data provided here, you're likely going to end up with a different, less accurate, result. This is especially the case if you're dealing with numbers that are fractions of 1.

Treatment 1 (X)	Diff(X - M)	Sq. Diff(X - M) ²
52	3.60	12.96
45	-3.40	11.56
50	1.60	2.56
49	0.60	0.36
52	3.60	12.96
47	-1.40	1.96
49	0.60	0.36
45	-3.40	11.56
51	2.60	6.76
44	-4.40	19.36
	M: 48.40	SS: 80.40

Treatment 2 (X)	Diff(X - M)	Sq. Diff(X - M) ²
51	-2.40	5.76
53	-0.40	0.16
54	0.60	0.36
52	-1.40	1.96
59	5.60	31.36
42	-11.40	129.96
57	3.60	12.96
59	5.60	31.36
49	-4.40	19.36
58	4.60	21.16
	M: 53.40	SS: 254.40

$$\begin{aligned}
 N_2 &: 10 \\
 df_2 &= N - 1 = 10 - 1 = 9 \\
 M_2 &: 53.4 \\
 SS_2 &: 254.4 \\
 s^2_2 &= SS_2 / (N - 1) = 254.4 / (10 - 1) = 28.27
 \end{aligned}$$

T-value Calculation

$$\begin{aligned}
 s^2_p &= ((df_1 / (df_1 + df_2)) * s^2_1) + ((df_2 / (df_1 + df_2)) * s^2_2) \\
 &= ((9 / 18) * 8.93) + ((9 / 18) * 28.27) = 18.6
 \end{aligned}$$

$$s^2_{M_1} = s^2_p / N_1 = 18.6 / 10 = 1.86$$

$$s^2_{M_2} = s^2_p / N_2 = 18.6 / 10 = 1.86$$

$$t = (M_1 - M_2) / \sqrt{(s^2_{M_1} + s^2_{M_2})} = -5 / \sqrt{3.72} = -2.59$$

The t -value is -2.59238. The p -value is .009196. The result is significant at $p < .05$.

Note: If you wish to calculate the effect size, [this calculator](#) will do the job.
